

Azure Update Manager Patch Compliance Programmer

PROBLEM STATEMENT:

Azure Virtual Machines need regular security and software updates to stay secure and reliable. If updates are not installed properly or on time, the systems may have security risks and performance issues. Patching can also cause application dependency problems or require Windows reboots during business hours. So, this project aims to provide a proper way to manage and schedule patches for Azure Virtual Machines. Here we use **Azure Update Manager** to manage updates, schedule maintenance, and monitor patch compliance.

OBJECTIVE:

The main objective of this project is to manage and maintain patch compliance for Azure Virtual Machines using **Azure Update Manager**.

The project aims to:

- Patch 60 Virtual Machines according to maintenance schedules.

- Keep Virtual Machines updated with required security and software patches.
- Reduce security risks caused by missing updates.
- Avoid unnecessary disruption to business operations.
- Monitor the patch compliance status of Virtual Machines.
- Provide compliance reports to management.

REQUIREMENTS:

Hardware Requirements:

- Laptop or computer

Software Requirements:

- Microsoft Azure account
- Microsoft Azure account
- Azure Virtual Machines
- Azure Update Manager
- Azure Portal
- Maintenance Configurations
- Patch assessment and patching features
- Compliance monitoring and reporting

ABSTRACT:

This project is about managing and monitoring the patch compliance of Azure Virtual Machines using **Azure Update Manager**. Our project is about making sure that Azure Virtual Machines receive the required security and software updates on time. We use Azure Update Manager to schedule and manage patches according to maintenance requirements. Our project provides a proper way to patch **60 Virtual Machines** while reducing disruption to business operations. We use maintenance schedules, patch assessment, patching, and compliance monitoring to manage the update process. This helps improve the security of Virtual Machines, reduce patching risks, and provide better visibility of patch compliance to management.
